
SIN WAVE

$$y = E \sin(kx - \omega t - \varphi) \quad (1)$$

SIN WAVE AND ITS PARAMETERS

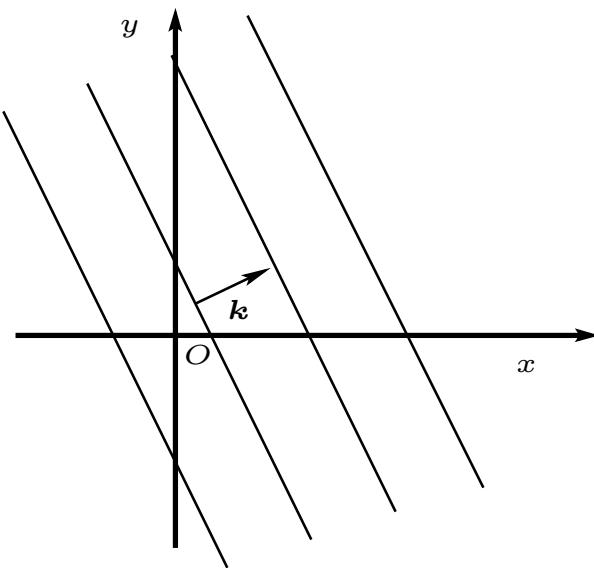

$$y = E \sin(kx - \omega t - \varphi) \quad (2)$$

$$k \underset{\text{def}}{=} \frac{2\pi}{\lambda} \quad (3)$$

$$\omega \underset{\text{def}}{=} \frac{2\pi}{T} \quad (4)$$

FLAT MONOCHROMATIC WAVE IN SPACE

A flat monochromatic wave in space can be given by the following vector equation:

$$E(\mathbf{r}, t) = E_0 \sin(\mathbf{k}\mathbf{r} - \omega t - \varphi) \quad (5)$$

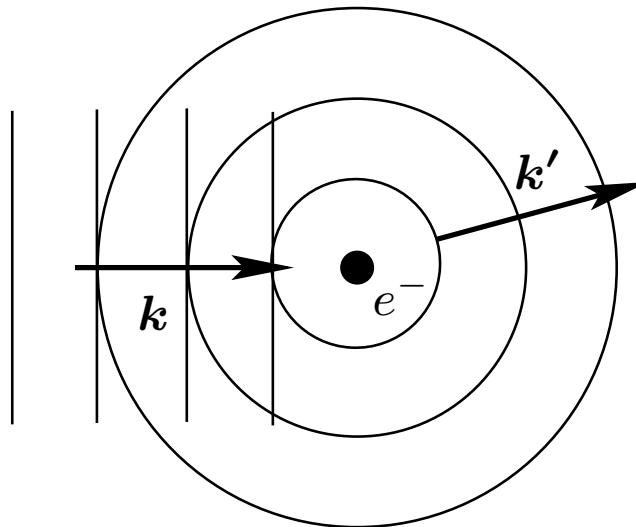

SUPERPOSITION OF TWO MONOCHROMATIC WAVES

Amplitudes of two electromagnetic waves add up:

$$E = E_1 + E_2 \tag{6}$$

SCATTERING BY AN ELECTRON

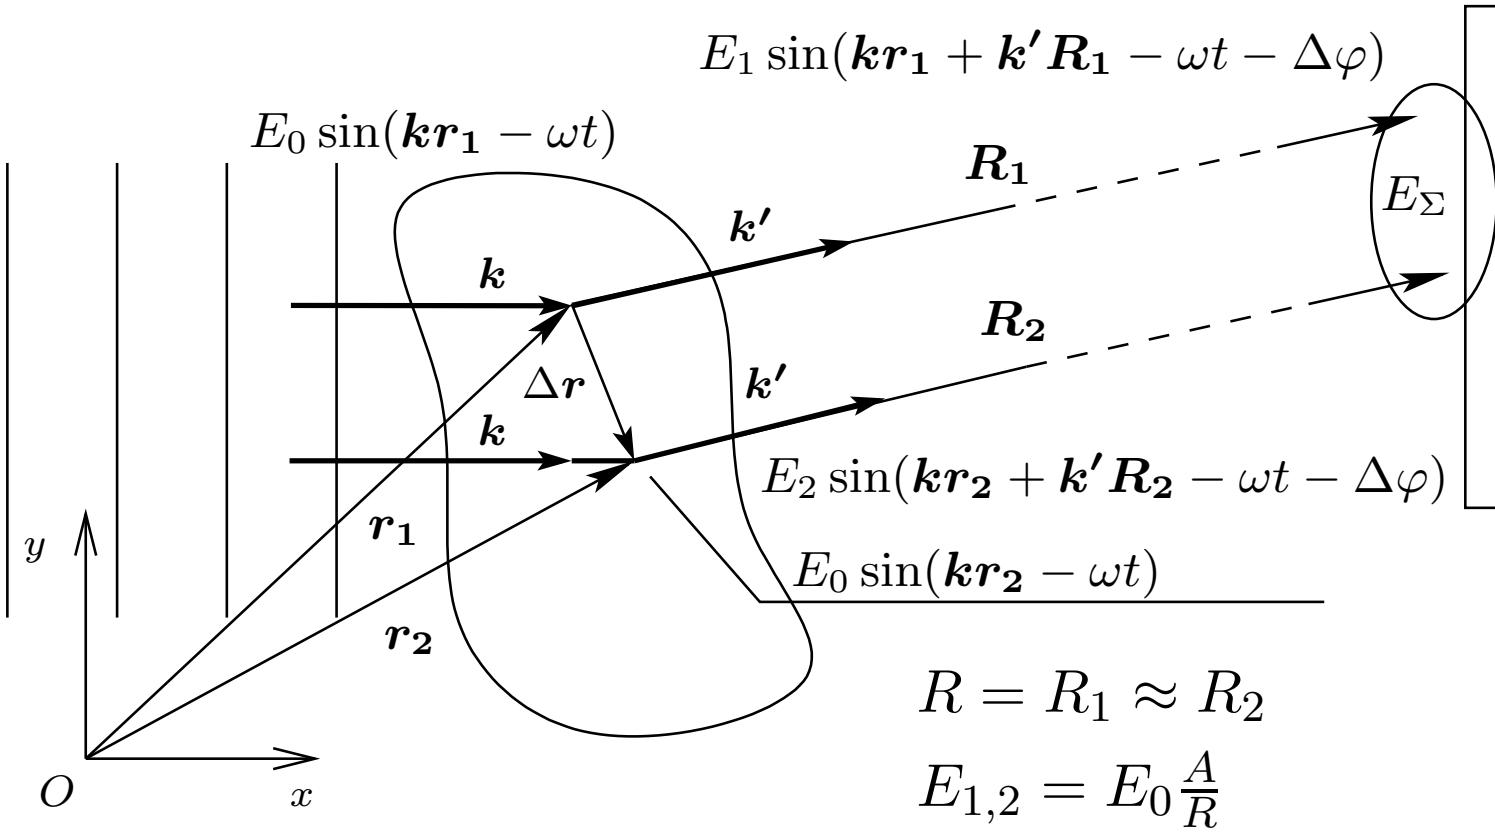

Thomson showed that:

$$E_1(\mathbf{R}, t) = E_1 \sin(\mathbf{k}' \cdot \mathbf{R} - \omega t - \Delta\varphi) \quad (7) \quad m_{p^+} \approx 1800 \cdot m_{e^-}$$

$$E_1 = E_0 \frac{1}{R} \frac{e^2}{mc^2} \sin \phi = E_0 \frac{A}{R} \quad (8) \quad I_1 \approx 2\% \cdot I_0$$

SCATTERING BY A SPECIMEN

$$E_\Sigma = E_1 \sin(\mathbf{k} \cdot \mathbf{r}_1 + \mathbf{k}' \cdot \mathbf{R}_1 - \omega t - \Delta\varphi) + E_2 \sin(\mathbf{k} \cdot \mathbf{r}_2 + \mathbf{k}' \cdot \mathbf{R}_2 - \omega t - \Delta\varphi) \quad (9)$$

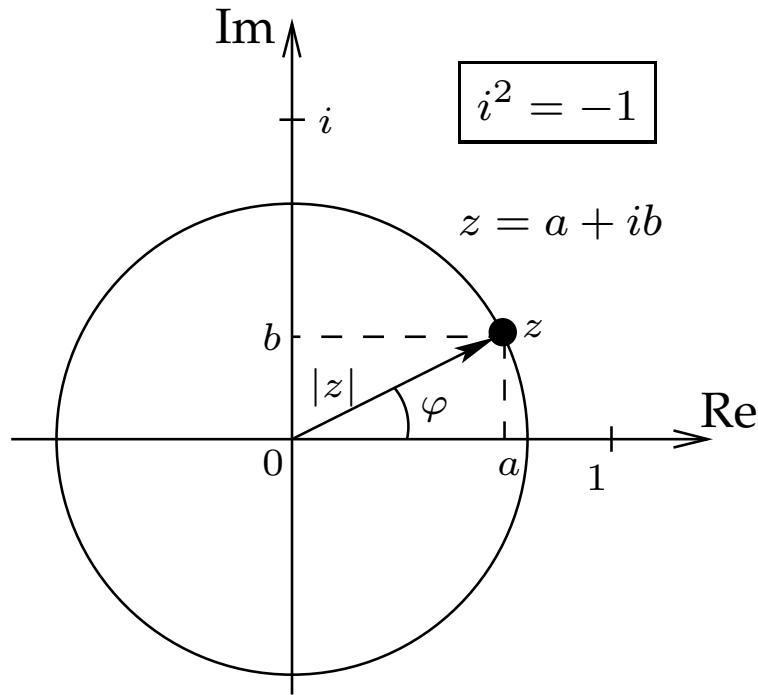

COMPLEX EXPONENTS

It is more convenient in physics to represent waves by complex exponents, using Euler's formula:

$$e^{ix} = \cos x + i \sin x \tag{10}$$

We just agree that instead of sin function, we write a complex exponent and always keep in mind that our real wave is just the imaginary part. Or real. If we care... :)

REMINISCENCES: COMPLEX NUMBERS ...

$$z = a + ib$$

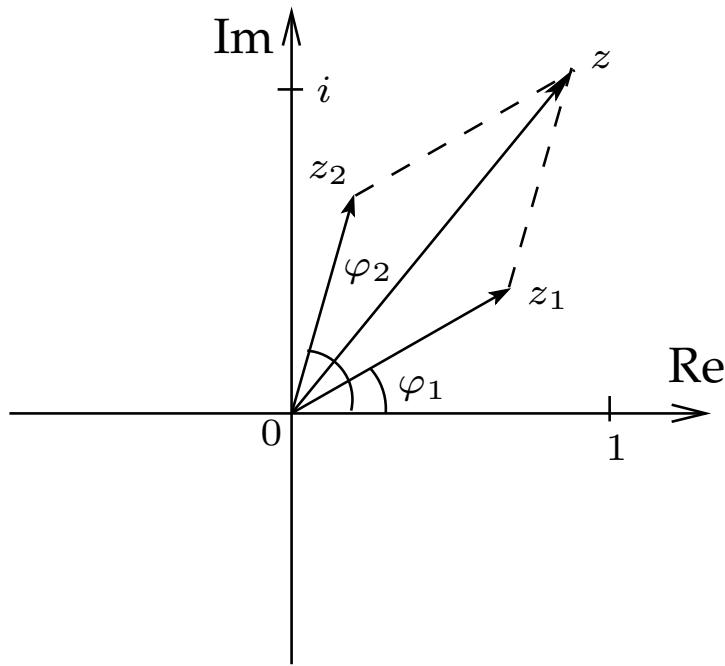

$$|z| = \sqrt{a^2 + b^2}$$

$$\tan \varphi = \frac{b}{a}$$

$$z^* = a - ib$$

$$|z|^2 = z \cdot z^*$$

REMINISCENCES: COMPLEX NUMBERS AS VECTORS ...

$$z = z_1 + z_2 = a + ib = (a_1 + a_2) + i(b_1 + b_2) \quad (11)$$

$$z_1 z_2 = (a_1 + ib_1)(a_2 + ib_2) = (a_1 a_2 - b_1 b_2) + i(a_1 b_2 + a_2 b_1) \quad (12)$$

OUTLINE OF EULER'S FORMULA PROOF...

$$e^{ix} = \cos x + i \sin x$$

$$\sin x = x - \frac{1}{3!}x^3 + \frac{1}{5!}x^5 - \cdots + (-1)^k \frac{1}{(2k+1)!}x^{2k+1} + \dots$$

$$i \sin x = ix + \frac{1}{3!}(ix)^3 + \frac{1}{5!}(ix)^5 + \cdots + \underbrace{(-1)^k i^{-2k-1} i}_{=1} \frac{1}{(2k+1)!}(ix)^{2k+1} + \dots$$

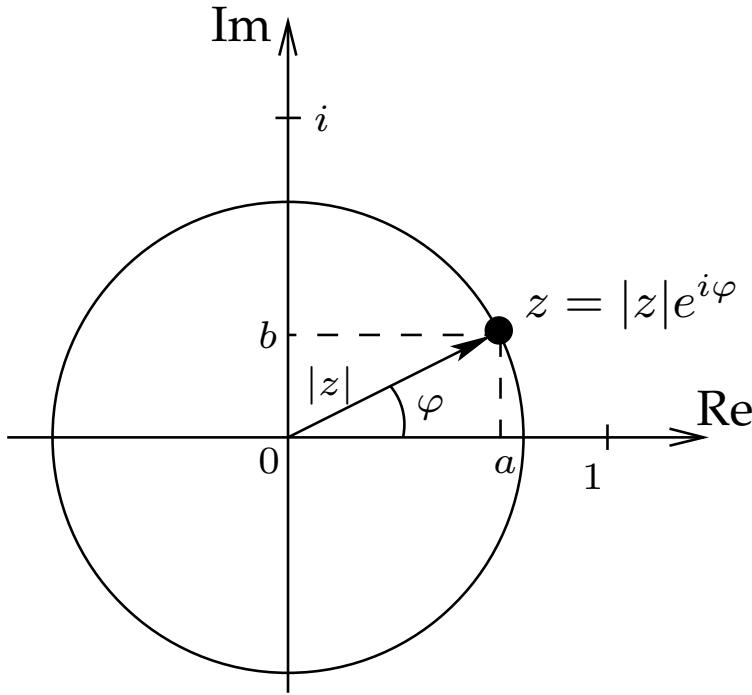

$$\cos x = 1 - \frac{1}{2!}x^2 + \frac{1}{4!}x^4 - \cdots + (-1)^k \frac{1}{(2k)!}x^{2k} + \dots$$

$$= 1 + \frac{1}{2!}(ix)^2 + \frac{1}{4!}(ix)^4 + \cdots + \underbrace{(-1)^k i^{-2k}}_{=1} \frac{1}{(2k)!}(ix)^{2k} + \dots$$

$$e^x = 1 + \frac{1}{1!}x + \frac{1}{2!}x^2 + \cdots + \frac{1}{k!}x^k + \dots$$

$$e^{ix} = 1 + ix + \frac{1}{2!}(ix)^2 + \frac{1}{3!}(ix)^3 + \frac{1}{4!}(ix)^4 + \cdots + \frac{1}{k!}(ix)^k + \dots$$

COMPLEX NUMBER AS EXPONENTS

$$|z| = \sqrt{a^2 + b^2} \quad a = |z| \cos \varphi \quad b = |z| \sin \varphi$$
